EXPERIMENT STATION

PREFACE

Through the McSweeney-McNary Act of 1928, Congress authorized the Secretary of Agriculture to conduct a survey of the forest resources of the United States. The Forest Survey was organized by the Forest Service to carry out the provisions of the Act. The Southeastern Forest Experiment Station, Asheville, North Carolina, is responsible for the work in Virginia, North Carolina, South Carolina, Georgia, and Florida. The Southern Forest Experiment Station, New Orleans, Louisiana, directs the work in Alabama, Arkansas, Louisiana, Mississippi, Oklahoma, Tennessee, and Texas.

The work of the Survey is divided into five major phases:

1. Inventory. Determination of the extent, location, and condition of forest lands, and the quantity, species, and quality of timber on these lands.

2. Growth and mortality. Determination of the current rate of timber growth, and the total loss resulting from fire, insects, disease, suppression, and other causes.

3. Timber cut. Determination of the amount of industrial and domestic wood used, and the amount removed by land clearing and cultural operations.

4. Requirements. Determination of the current and probable future requirements for forest products by all classes of consumers.

5. Policies and plans. Analysis of the relation of these findings to one another and to other economic factors as a basis for public and private policies and plans of forest land use and management.

ACKNOWLEDGMENT

The statistics presented herein are based upon reports furnished by the wood procurement officials representing 72 mills located in or drawing wood from the South. Reports showed production either by county or by shipping points that were used to assign production to counties. County data are approximate, but totals for small groups of counties should have little error.

1956 PULPWOOD PRODUCTION IN THE SOUTH

Joe F. Christopher and Martha E. Nelson
Southern Forest Experiment Station

In 1956, for the seventh consecutive year, pulpwood production by the 12 southern States established a new record. The total cut was 20,344,900 cords, an increase of 10.6 percent over 1955. Of this amount, roundwood accounted for 19,685,800 cords and residues from wood-using industries for 659,100 cords. Southern pines made up 86 percent of the 1956 total, and hardwoods 14 percent.

Production now is considerably more than double what it was in 1946, when the first of these annual summaries was issued. As figure 2 shows, the pine harvest has climbed from 7.6 million cords to 17.4 million. The volume of hardwood has risen from 1.2 million cords annually to 2.9 million. Proportionally, the gain in hardwood use has been somewhat faster than that for pine.

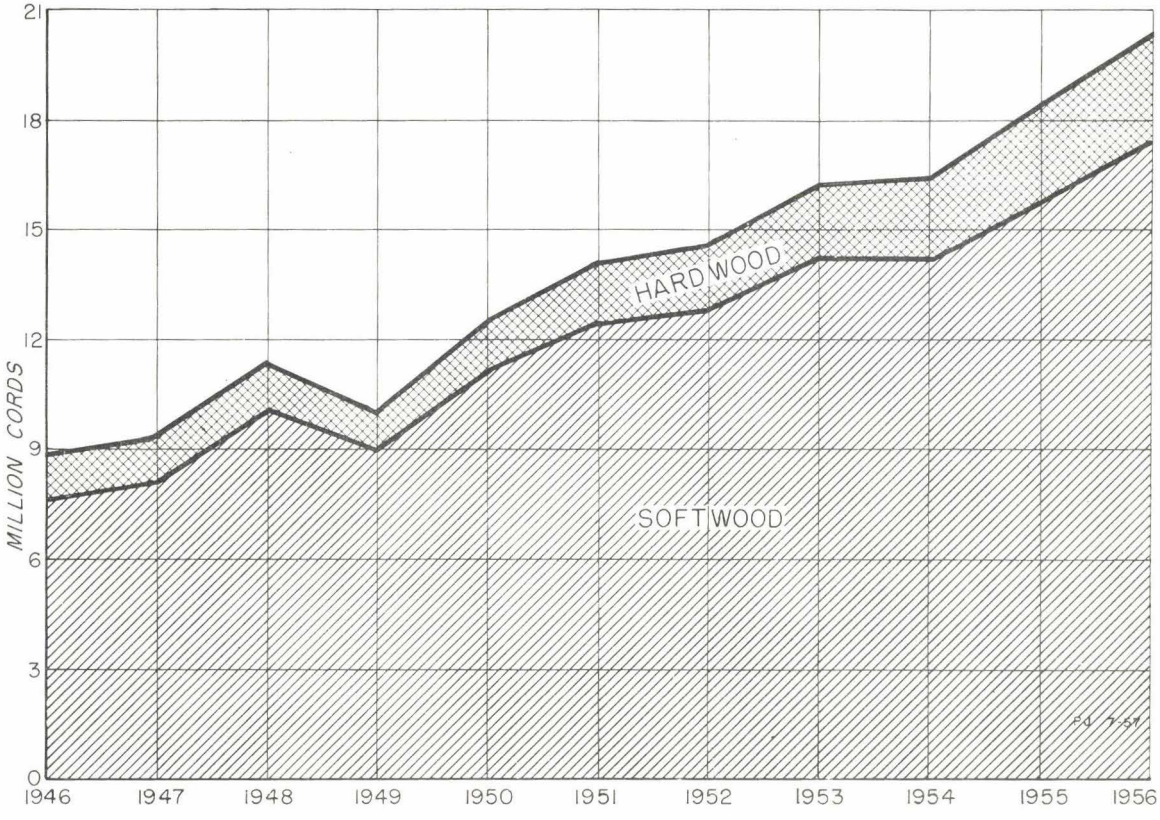

Figure 2. --Total pulpwood production in the South, 1946-56. (Includes residues.)

[1] Includes 26,100 cords of chestnut used for pulp.

A recent and spectacular development has been the increase in the pulping of residues from sawmills, veneer plants, and other wood-manufacturing industries--material that formerly was burned as waste, or, at best, used for fuel. Wood residues chipped for pulp jumped from 126,000 cords in 1954 to 374,000 cords in 1955. Last year, this material furnished 659,000 cords, or more than 3 percent of the total southern pulpwood production. As the following tabulation indicates, most of this volume was from coarse waste at sawmills and veneer plants:

	Pine	Hardwood	Total
	(thousand cords)		
Sawmill and veneer plant chips	488	46	534
Unchipped veneer cores and cull crossties		110	110
Pole and piling ends, etc.	15		15
	503	156	659

Use of residues for pulp is almost certain to increase rapidly, for more and more sawmills are installing equipment for converting

their heavy waste to pulp chips. It seems appropriate, therefore, to begin reporting roundwood and residues separately. The Southwide summary tables (tables 2 and 3) have accordingly been rearranged to show pulpwood from both sources. The tables for production by counties (tables 4-15) are restricted to roundwood only.

Georgia was the largest producer of pulpwood in 1956, accounting for nearly 4 million cords (fig. 3), 19 percent of the South's total. Alabama and Mississippi harvested over 2 million cords each, and six other States cut more than 1.5 million cords apiece. Baldwin county, Alabama, led in county production of round pulpwood, with some 193,000 cords. Also in the 100,000-cord bracket were Baker county in Florida, Charlton and Clinch counties in Georgia, Union and Winn parishes in Louisiana, and Fairfield and Georgetown counties in South Carolina.

In 1956, no pulpwood was reported as being taken from blight-killed chestnut. Though the quantity had been steadily declining, some chestnut pulpwood had hitherto been cut each year from the mountain forests of Alabama, Georgia, North Carolina, Tennessee, and Virginia. Now many of the dead trees have been salvaged, and most of those that remain are too heavily damaged by insects or decay to be worth cutting for pulpwood.

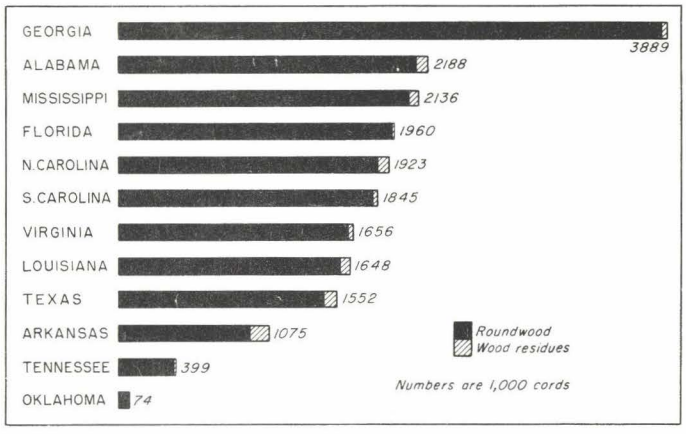

Figure 3.--Pulpwood production in the South, 1956. Roundwood and residues combined.

Pulping capacity in the South continues to rise. The 68 southern mills in operation at the end of 1956 had a daily capacity of 38,000 tons of pulp output--an increase of 12 percent over 1955. In 1946, total southern pulping capacity was 16,000 tons daily. Nine additional mills are under construction or definitely planned (table 17). Four mills outside the region also draw wood from southern forests (fig. 1).
